STAT 511A HW 2

Kathleen Wendt

Load packages

```
library(readr)
library(magrittr)
library(ggplot2)
```

Part 1

Assume Z has a standard normal distribution.

Part 1A

```
P(Z <= 0.64) pnorm(0.64)
```

[1] 0.7389137

Part 1B

```
P(Z \le -0.37) pnorm(-0.37)
```

[1] 0.3556912

Part 1C

```
P(Z > 1.24)
pnorm(1.24, lower.tail = FALSE)

## [1] 0.1074877

1 - pnorm(1.24)
```

Part 1D

[1] 0.1074877

```
P(-0.37 <= Z <= 1.15)
pnorm(1.15) - pnorm(-0.37)
```

[1] 0.5192368

Part 1E

```
Find z such that P(Z \le z) = 0.3300
qnorm(0.3300)
```

[1] -0.4399132

Part 1F

```
Find z such that P(Z > z) = 0.1841

qnorm(0.1841, lower.tail = FALSE)
```

[1] 0.8998502

Part 2

Assume that Y has a normal distribution with mean of 5.4 and standard deviation of 0.2.

Part 2A

```
P(Y \le 5.7)
pnorm(5.7, mean = 5.4, sd = 0.2)
## [1] 0.9331928
```

Part 2B

```
P(Y > 5.3)
pnorm(5.3, mean = 5.4, sd = 0.2, lower.tail = FALSE)
```

Part 2C

[1] 0.6914625

```
P(5.2 <= Y <= 5.5)
pnorm(5.5, mean = 5.4, sd = 0.2) - pnorm(5.2, mean = 5.4, sd = 0.2)
## [1] 0.5328072
```

Part 2D

Find the value y such that $P(Y \le y) = 0.85$.

```
qnorm(0.85, mean = 5.4, sd = 0.2)
```

[1] 5.607287

Part 3

Let Y have a *skewed* distribution ($\mu = 80$, $\sigma = 5$). Suppose a random sample of n = 100 is drawn from the population.

Part 3A

Based on the Chebyshev's Rule (selected based on skewness), at least 75% of the sample data will lie between 70 and 90.

Part 3B

The sample distribution would be similar to the population distribution, such that its μ would be close to 80 and its σ would be close to 5 with a similar level of skewness. Based on the Central Limit Theorem, if more and more samples of 100 are drawn randomly, the sampling distribution of the sample mean will approach normality.

Part 4

Seed Data

Part 4A

Read Data

```
seeds <- read_csv("Seeds.csv")

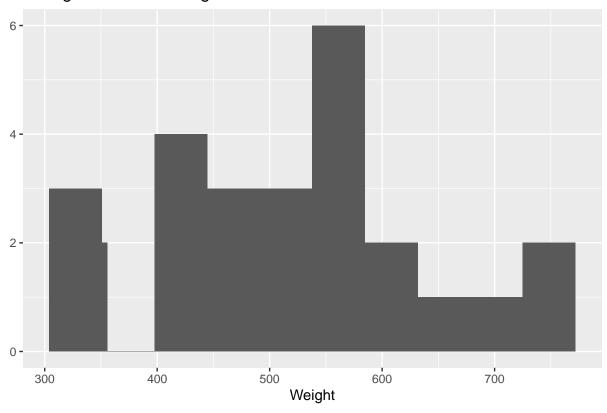

## Parsed with column specification:
## cols(
## Weight = col_double()
## )</pre>
```

Histogram

```
qplot(Weight, data = seeds) +
  stat_bin(bins = 10) +
  ggtitle("Histogram of Seed Weight")
```

`stat_bin()` using `bins = 30`. Pick better value with `binwidth`.

Histogram of Seed Weight

Sample Mean

```
mean(seeds$Weight)
```

[1] 526.12

Sample Standard Deviation

```
sd(seeds$Weight)
```

[1] 113.7279

Part 4B - I might need to redo some of this later this week

Construct a 95% confidence interval for seed μ .

```
seed_ci <- t.test(seeds$Weight)
seed_ci$conf.int</pre>
```

```
## [1] 479.1754 573.0646
## attr(,"conf.level")
## [1] 0.95
```

The 95% confidence interval of seed weight is 479.12 and 573.06.

Part 4C

Interpret confidence interval.

A confidence interval is an interval of values computed from sample data that is almost sure to cover the true population parameter. In this case, if 100 samples of seeds' weights were collected, 95 of the samples would contain the true μ (population mean seed weight) (between 479.12 and 573.06).

Part 4D

Is the CI valid? Discuss whether assumptions were satisfied.

The validity of the above confidence interval is unknown.
